

Flange thickness, head to vessel main flanges, using Movesa suggested design of Dec 3, 2012:

inner radius max. allowable pressure
 $R_{i_pv} = 0.68 \text{ m}$ $P = 15.4 \text{ bar}$ (gauge pressure)

D. Shuman Dec 8, 2012

The flange design for O-ring sealing (or other self energizing gasket such as helico flex) is "flat-faced", with "metal to metal contact outside the bolt circle". This design avoids the high flange bending stresses found in a raised face flange (of Appendix 2) and will result in less flange thickness. The rules for this design are found only in sec VIII division 1 under Appendix Y, and must be used with the allowable stresses of division 1. Flanges and shells will be fabricated from 316Ti (ASME spec SA-240) stainless steel plate. Plate samples will be helium leak checked before fabrication, as well as ultrasound inspected for flat laminar flaws which may create leak paths. The flange bolts and nuts for a metal C-ring gasket seal will be inconel 718, (UNS N77180) as this is the highest strength non-corrosive material allowed for bolting. For O-ring sealing we can use carbon steel bolts ASTM SA-574M. We design the flanges for both cases, using the parallel calculation mode of MathCAD in which the possible values for a parameter are expressed as a matrix. The O-ring/carbon steel bolt cas is the upper number and the Helico flex/Inconel 718 is the lower number Calculations are then performed in parallel for each row index. Where necessary (multiple vectors in an expression) an arrow over the expression enforces this parallel calculation mode.

Maximum allowable material stresses, for sec VIII, division 1 rules from ASME 2010 Pressure Vessel code, sec. II part D, table 2A (division 1 only):

Maximum allowable design stress for flange

$$S_f := S_{\max_316Ti_div1} \quad S_f = 137.9 \text{ MPa} \quad S_f = 2 \times 10^4 \text{ psi}$$

Maximum allowable design stress for bolts, from ASME 2010 Pressure Vessel code, sec. II part D, table 3

$$\begin{array}{l} \text{Inconel 718 (UNS N07718)} \quad S_{\max_N07718} := 37000 \text{ psi} \quad S_{\max_SA_574} := 33800 \text{ psi or bolts} \Rightarrow 5/8 \text{ in} \\ S_b := \begin{pmatrix} S_{\max_SA_574} \\ S_{\max_N07718} \end{pmatrix} \quad S_b = \begin{pmatrix} 233 \\ 255.1 \end{pmatrix} \text{ MPa} \end{array}$$

From sec. VIII div 1, non-mandatory appendix Y for bolted joints having metal-to-metal contact outside of

bolt circle. First define, per Y-3:

FIG. Y-3.2 FLANGE DIMENSIONS AND FORCES

hub thickness at flange (no hub)

corner radius:

$$g_0 := t_{pv} \quad g_1 := t_{pv} \quad g_0 = 10 \text{ mm} \quad g_1 = 10 \text{ mm} \quad r_1 := \max(.25g_1, 5\text{mm}) \quad r_1 = 5 \text{ mm}$$

Flange OD

$$A := \begin{pmatrix} 1.48 \\ 1.48 \end{pmatrix} \text{ m}$$

Steel bolts (A-574 SHCS, O-ring seals

Inconel 718 bolts, helico flex low force C-ring

note: corner radius is not included in g_1
as shown in top drawing of Fig. Y-3.2, above

Flange ID

$$B := 2R_{i_{pv}} \quad B = 1.36 \text{ m}$$

define:

$$B_1 := B + g_1 \quad B_1 = 1.37 \text{ m}$$

Bolt circle (B.C.) dia, C:

$$C := 1.43 \cdot m$$

Appendix Y refers to Appendix 2-5 (c) regarding how to treat self-energizing gaskets such as O-rings.

Paragraph 2-5 (c)(3) states that for self-energizing gaskets, gasket compression load H_p is to be considered as = 0 (except for certain special types, that are not applicable here) and that the bolt load W_{m1} be computed using the outer gasket diameter. For Helicoflex, average diameter is used:

Gasket width

$$b := 5mm$$

Gasket diameter:

$$G := \left(\frac{1.373}{1.3755} \right)_m \quad \text{O-ring mean radius as measured in CAD model: } 68.65 \cdot 2 = 137.3$$

Force of Pressure on head

$$H := .785G^2 \cdot P \quad H = \begin{pmatrix} 2.279 \times 10^6 \\ 2.287 \times 10^6 \end{pmatrix} N \quad H = \begin{pmatrix} 2.324 \times 10^5 \\ 2.332 \times 10^5 \end{pmatrix} kgf$$

Sealing force, per unit length of circumference:

for 4.78mm C-ring, M surface hardness:

$$Y_2 := \begin{pmatrix} 0 \\ 65 \end{pmatrix} \frac{N}{mm} \quad \text{recommended value for large diameter seals, regardless of pressure or leak rate}$$

Gasket Load:

$$H_G := \overrightarrow{(\pi G \cdot Y_2)} \quad H_G = \begin{pmatrix} 0 \\ 2.809 \times 10^5 \end{pmatrix} N$$

Start by making trial assumption for number of bolts, nominal bolt dia., nut width (corner), wrench clearance (box), thread pitch, and bolt hole dia D,

num of bolts	bolt dia	nut width (c-c)	wrench clearances, from Mach. HDBK, 3/4")	
$n := 102$	$d_b := 20mm$	$d_e := 35mm$	radius to corner $r_{wr} := .68in$ $r_{wr} = 17.272 mm$	cc- to adjacent bolt $d_{wr} := 1.1in$ $d_{wr} = 27.94 mm$

maximum number of bolts possible, using narrow washers (OD=2x bolt dia):

$$n_{max} := \text{trunc} \left(\frac{\pi C}{d_e} \right) \quad n_{max} = 128 \quad n_{max} > n = 1$$

Check strength restriction: $d_b \Rightarrow 5/8in$

$$d_b \geq 0.625in = 1$$

Choosing ISO coarse thread for CS, thread depth is:

$$p_t := \begin{pmatrix} 2.5 \\ 2.5 \end{pmatrix} \text{mm} \quad h_3 := .6134 \cdot p_t \quad h_3 = \begin{pmatrix} 1.533 \\ 1.533 \end{pmatrix} \text{mm}$$

using nomenclature and formulas from this chart at <http://www.tribology-abc.com/calculators/metric-iso.htm>

metric screw threads ISO 724 (DIN 13 T1)

<---use h3 for 1.0 mm pitch

<--- use H1 for 1.5mm pitch

Bolt root dia. is then:

$$d_3 := d_b - 2h_3 \quad d_3 = \begin{pmatrix} 16.933 \\ 16.933 \end{pmatrix} \text{mm}$$

Total bolt cross sectional area:

$$A_b := n \cdot \frac{\pi}{4} d_3^2 \quad A_b = \begin{pmatrix} 229.698 \\ 229.698 \end{pmatrix} \text{cm}^2$$

Check bolt to bolt clearance, washer to radius (r1) clearance. Assume box wrench can protrude into r1 a bit
washer OD:

$$d_w := 35 \text{mm}$$

$$\pi C - n \cdot d_w \geq 0 = 1 \quad \text{actual bolt to bolt distance: } \frac{\pi C}{n} = 44.044 \text{mm}$$

Check nut, washer, socket clearance:

$$0.5C - (0.5B + g_1 + r_1) \geq 0.5d_w = 1$$

this is for standard narrow washers, and for wrench sockets which more than cover the nut width across corners

Check minimum bolt circle

$$0.5B + g_1 + r_1 + 0.5 \cdot d_w \leq 0.5C = 1$$

Flange hole diameter, minimum for clearance :

$$D_{tmin} := d_b + 2\text{mm} \quad D_{tmin} = 22\text{mm}$$

We will thread some of these clearance holes for lift fixture bolts of size (db+4mm) to allow the head retraction fixture to be bolted up the the flange. The effective diameter of these holes will be the average of nominal and minimum diameters. To avoid thread interference with flange bolts, the flange studs will be machined to root diameter per **UG-12(b)** in between threaded ends of 1.5x diameter in length. The actual clearance holes will be db+2mm, depending on achievable tolerances, so as to allow threading where needed.

$$d_{lfb} := d_b + 4\text{mm} \quad \text{from chart above, formula for H1}$$

$$H_{1_M24_2} := .547 \cdot 2\text{mm} \quad H_{1_M24_2} = 1.094\text{mm}$$

$$d_{min_lfb} := d_{lfb} - 2 \cdot H_{1_M24_2} \quad d_{min_lfb} = 2.181\text{mm}$$

this will be max bolt hole size or least material condition (LMC)

$$d_{min_lfb} \geq D_{tmin} = 0$$

However the difference is very small for 2mm pitch, and negligible female thread is lost

effective threaded clearance hole diameter:

$$D_e := 0.5(d_{lfb} + D_{tmin}) \quad D_e = 2.3\text{mm}$$

Set:

$$D_t := D_e$$

$$D_t \geq D_{tmin} = 1$$

Compute Forces on flange:

$$H_P := 0\text{N}$$

$$H_P = 0\text{N}$$

$$H_P = 0\text{kgf}$$

$$H_G = \begin{pmatrix} 0 \\ 2.809 \times 10^5 \end{pmatrix} \text{N}$$

$$H_G = \begin{pmatrix} 0 \\ 2.864 \times 10^4 \end{pmatrix} \text{kgf}$$

$$h_G := 0.5(C - G)$$

$$h_G = \begin{pmatrix} 2.85 \\ 2.725 \end{pmatrix} \text{cm}$$

from Table 2-6 Appendix 2, Integral flanges

$$H_D := .785 \cdot B^2 \cdot P$$

$$H_D = 2.236 \times 10^6 \text{N}$$

$$H_D = 2.28 \times 10^5 \text{kgf}$$

$$R_s := 0.5(C - B) - g_1$$

$$R_s = 2.5\text{cm}$$

radial distance, B.C. to hub-flange intersection, int fl..

$$h_D := R_s + 0.5g_1$$

$$h_D = 3\text{cm}$$

from Table 2-6 Appendix 2, Int. fl.

$$H_T := H - H_D$$

$$H_T = \begin{pmatrix} 4.295 \times 10^4 \\ 5.126 \times 10^4 \end{pmatrix} \text{N}$$

$$h_T := 0.5(R_s + g_1 + h_G) \quad h_T = \begin{pmatrix} 31.75 \\ 31.125 \end{pmatrix} \text{mm}$$

from Table 2-6 Appendix 2, int. fl.

Total Moment on Flange

$$M_P := \overrightarrow{(H_D \cdot h_D + H_T \cdot h_T + H_G \cdot h_G)} \quad M_P = \begin{pmatrix} 6.844 \times 10^4 \\ 7.633 \times 10^4 \end{pmatrix} \text{ J} \quad M_P = \begin{pmatrix} 6.979 \times 10^3 \\ 7.783 \times 10^3 \end{pmatrix} \text{ kgf} \cdot \text{m}$$

Appendix Y Calculation

$$P = 15.4 \text{ bar}$$

Choose values for plate thickness and bolt hole dia:

$$t := 4.0 \text{ cm} \quad D := D_t \quad D = 2.3 \text{ cm}$$

$$M_D := \overrightarrow{(H_D \cdot h_D)} \quad M_D = 6.708 \times 10^4 \text{ J}$$

$$M_T := \overrightarrow{(H_T \cdot h_T)} \quad M_T = \begin{pmatrix} 139.058 \\ 162.685 \end{pmatrix} \text{ kgf} \cdot \text{m}$$

Going back to main analysis, compute the following quantities:

$$\beta := \frac{C + B_1}{2B_1} \quad \beta = 1.022 \quad h_C := 0.5(A - C) \quad h_C = \begin{pmatrix} 2.5 \\ 2.5 \end{pmatrix} \text{ cm}$$

$$a := \frac{A + C}{2B_1} \quad a = \begin{pmatrix} 1.062 \\ 1.062 \end{pmatrix} \quad AR := \frac{n \cdot D}{\pi \cdot C} \quad AR = 0.522 \quad h_0 := \sqrt{B \cdot g_0} \quad h_0 = 11.662 \text{ cm}$$

$$r_B := \frac{1}{n} \left(\frac{4}{\sqrt{1 - AR^2}} \operatorname{atan} \left(\sqrt{\frac{1 + AR}{1 - AR}} \right) - \pi - 2AR \right) \quad r_B = 7.709 \times 10^{-3}$$

We need factors F and V, most easily found in figs 2-7.2 and 7.3 (Appendix 2)

$$\text{since } \frac{g_1}{g_0} = 1 \quad \text{these values converge to } F := 0.90892 \quad V := 0.550103$$

Y-5 Classification and Categorization

We have identical (class 1 assembly) integral (category 1) flanges, so from table Y-6.1, our applicable equations are (5a), (7) - (13), (14a), (15a), (16a)

$$(5a) \quad J_S := \overrightarrow{\left[\frac{1}{B_1} \left(\frac{2 \cdot h_D}{\beta} + \frac{h_C}{a} \right) + \pi r_B \right]} \quad J_S = \begin{pmatrix} 0.084 \\ 0.084 \end{pmatrix} \quad J_P := \overrightarrow{\left[\frac{1}{B_1} \left(\frac{h_D}{\beta} + \frac{h_C}{a} \right) + \pi r_B \right]} \quad J_P = \begin{pmatrix} 0.063 \\ 0.063 \end{pmatrix}$$

$$F' := \frac{g_0^2 (h_0 + F \cdot t)}{V} \quad F' = 2.781 \times 10^{-5} \text{ m}^3 \quad M_P = \begin{pmatrix} 6.844 \times 10^4 \\ 7.633 \times 10^4 \end{pmatrix} \text{ N} \cdot \text{m} \quad M_P = \begin{pmatrix} 6.979 \times 10^3 \\ 7.783 \times 10^3 \end{pmatrix} \text{ k}$$

$$A = \begin{pmatrix} 1.48 \\ 1.48 \end{pmatrix} \text{ m} \quad B = 1.36 \text{ m} \quad \longrightarrow$$

$$K := \frac{A}{B} \quad K = \begin{pmatrix} 1.088 \\ 1.088 \end{pmatrix} \quad Z := \frac{K^2 + 1}{K^2 - 1} \quad Z = \begin{pmatrix} 11.854 \\ 11.854 \end{pmatrix}$$

$f := 1$ hub stress correction factor for integral flanges, use $f = 1$ for $g_1/g_0 = 1$ (fig 2-7.6)

$t_s := 0 \text{ mm}$ no spacer between flanges

$l := 2t + t_s + 0.5d_b \quad l = 9 \text{ cm}$ strain length of bolt (for class 1 assembly)

Y-6.1, Class 1 Assembly Analysis

Design Prestress in bolts

$$S_i := \left[\sigma_b - \frac{1.159 \cdot h_C^2 \cdot (M_P + M_S)}{a \cdot t^3 \cdot r_E \cdot B_1} \right] \quad S_i = \begin{pmatrix} 209.3 \\ 234.4 \end{pmatrix} \text{MPa} \quad (12)$$

Radial Flange stress at bolt circle

$$S_{R_BC} := \frac{6(M_P + M_S)}{t^2(\pi \cdot C - n \cdot D)} \quad S_{R_BC} = \begin{pmatrix} 116.4 \\ 129.8 \end{pmatrix} \text{MPa} \quad (13)$$

Radial Flange stress at inside diameter

$$S_{R_ID} := \left[-\left(\frac{2F \cdot t}{h_0 + F \cdot t} + 6 \right) \cdot \frac{M_S}{\pi B_1 \cdot t^2} \right] \quad S_{R_ID} = \begin{pmatrix} 1.695 \\ 1.89 \end{pmatrix} \text{MPa} \quad (14a)$$

Tangential Flange stress at inside diameter

$$S_T := \left[\frac{t \cdot E \cdot \theta_B}{B_1} + \left(\frac{2F \cdot t \cdot Z}{h_0 + F \cdot t} - 1.8 \right) \cdot \frac{M_S}{\pi B_1 \cdot t^2} \right] \quad S_T = \begin{pmatrix} 2.29 \\ 2.55 \end{pmatrix} \text{MPa} \quad (15a)$$

Longitudinal hub stress

$$S_H := \frac{h_0 \cdot E \cdot \theta_B \cdot f}{0.91 \left(\frac{g_1}{g_0} \right)^2 B_1 \cdot V} \quad S_H = \left(\frac{19.156}{21.363} \right) \text{MPa} \quad (16a)$$

Y-7 Bolt and Flange stress allowables: $S_b = \left(\frac{233}{255.1} \right) \text{MPa}$ $S_f = 137.9 \text{MPa}$

- (a) $\overrightarrow{(\sigma_b \leq S_b)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
- (b) (1) $\overrightarrow{(S_H \leq 1.5 S_f)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$ S_n not applicable
 (2) not applicable
- (c) $\overrightarrow{(S_{R_BC} \leq S_f)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
 $\overrightarrow{(S_{R_ID} \leq S_f)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
- (d) $\overrightarrow{(S_T \leq S_f)} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
- (e) $\overrightarrow{\frac{S_H + S_{R_BC}}{2} \leq S_f} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
 $\overrightarrow{\frac{S_H + S_{R_ID}}{2} \leq S_f} = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$
- (f) not applicable

Bolt force

$$F_{\text{bolt}} := \sigma_b \cdot .785 \cdot d_b^2 \quad F_{\text{bolt}} = \left(\frac{6.759 \times 10^4}{7.574 \times 10^4} \right) \text{N}$$

Bolt torque required, minimum:

$$T_{\text{bolt_min}} := 0.2 F_{\text{bolt}} \cdot d_b \quad T_{\text{bolt_min}} = \left(\frac{270.4}{303} \right) \text{N} \cdot T_{\text{bolt_min}} = \left(\frac{199.4}{223.5} \right) \text{lbf} \cdot \text{ft} \quad \text{for pressure test use 1.5x this value}$$

This is the minimum amount of bolt preload needed to assure joint does not open under pressure. An additional amount of bolt preload is needed to maintain a minimum frictional shear resistance to assure head does not slide downward from weight; we do not want to depend on lip to carry this. Non-mandatory Appendix S of div. 1 makes permissible higher bolt stresses than indicated above when needed to assure full gasket sealing and other conditions. This is consistent with proper preloaded joint practice, for properly designed joints where connection stiffness is much greater than bolt stiffness, and we are a long way from the yield stress of the bolts

$$M_{\text{head}} := 2500 \text{kg} \quad \mu_{SS_SS} := .7 \quad \text{typ. coefficient of friction, stainless steel (both) clean and dry}$$

$$V_{\text{head}} := M_{\text{head}} \cdot g \quad V_{\text{head}} = 2.452 \times 10^4 \text{N}$$

$$F_n := \frac{V_{\text{head}}}{\mu_{SS_SS}} \quad F_n = 3.502 \times 10^4 \text{N} \quad \text{this is total required force, force required per bolt is:}$$

$$F_{n_bolt} := \frac{F_n}{n} \quad F_{n_bolt} = 343.37 \text{N} \quad \text{this is insignificant compared to that required for pressure.}$$

Let bolt torque for normal operation be then 25% greater than minimum:
